

A Two Page Guide to R

Andy Grogan-Kaylor

February 12, 2021

1 Why?

R has a reputation for being difficult to learn, and a lot of that reputation is deserved.

R is open source, and therefore free, statistical software that is particularly good at obtaining, analyzing and visualizing data.¹

I believe that it is possible to teach R in an accessible way, and that **a little bit of R can take you a long way.**

A great deal of data analysis and visualization involves the same core set of steps.²

have a question → get data → process and clean data →
visualize data → analyze data → make conclusions

2 Get R³

3 Get Data⁴

```
load("the/path/to/mydata.Rdata") # data in R format

library(foreign) # library for importing data
mydata <- read.spss("the/path/to/mySPSSfile.sav") # SPSS
mydata <- read.dta("the/path/to/myStatafile.dta") # Stata

library(readxl) # library for importing Excel files
mydata <- read_excel("the/path/to/mySpreadsheet.xls")

save(mydata, file = "mydata.RData") # save in R format
```

4 Process and Clean Data^{5 6 7}

```
mydata$x[mydata$x == -9] <- NA # missing to NA

mydata$w <- factor(mydata$z, # original numeric variable
  levels = c(0, 1, 2),
  labels = c("Group A", "Group B", "Group C"),
  ordered = TRUE) # whether order matters

mydata$z <- as.numeric(mydata$w) # factor to numeric
```

¹ R Commands are stored in a *script* or *code* file that usually ends in .R, e.g. myRscript.R. The command file is distinct from your actual data, stored in an .RData file, e.g. mydata.RData.

² Given the fact that we often want to apply the same core set of tasks to new questions and new data, there are ways to overcome the steep learning curve and learn a replicable set of commands that can be applied to problem after problem. **The same 5 to 10 lines of R code can often be tweaked over and over again for multiple projects.**

³ R is available at <https://www.r-project.org/>. R is a lot easier to run if you run it from RStudio, <http://www.rstudio.com>.

⁴ Data often comes from other types of data files like SPSS, Stata, or Excel. Especially in beginning R programming, getting the data into R can be the most complicated part of your program.

⁷ You *don't* need to use all of the options. e.g. mydata\$w <- factor(mydata\$z) will work just fine. **Changing variables from factor to numeric, and vice versa can sometimes be the simple solution that solves a lot of problems when you are trying to graph your variables.**

5 Visualize Data

5.1 Histogram⁸

```
hist(mydata$x, # what I'm graphing
     main = "your title goes here", # title
     xlab = "income", # label for x axis
     col = "blue") # color
```

⁸ You *don't* need to use all of the options.
e.g. `hist(mydata$x)` will work just fine.

5.2 Barplot⁹

```
barplot(table(mydata$z), # what I'm graphing
        names.arg = c("Group A", "Group B"), # names for bars
        main = "your title goes here", # title
        xlab = "group", # label for x axis
        col = "gold") # color
```

⁹ You *don't* need to use all of the options.
e.g. `barplot(table(mydata$z))` will work just fine.

5.3 Scatterplot^{10 11}

```
plot(mydata$x, mydata$y, # plot x and y
     main = "your title goes here", # title
     xlab = "income", # label for x axis
     ylab = "mental health", # label for y axis
     pch = 19, # Plot CHaracter, 19 is filled dots
     las = 2, # LAbel Style, 2 is "perpendicular"
     col = "darkgreen") # color
```

¹¹ When scatterplots have fewer dots than you think they should have, often due to "over-printing", adding some random noise, or "jittering" the dots in the scatterplot may help: `plot(jitter(mydata$y, factor = 5000) ~ mydata$x)`. Experiment with different sizes of *factor*.

6 Analyze Data: Descriptive Statistics¹²

```
summary(mydata$x) # for continuous or factor variables
```

```
##      Min. 1st Qu.  Median    Mean 3rd Qu.    Max.
##  82.09   93.79   99.81   99.90  104.74  124.45
```

```
table(mydata$z) # especially suitable for factor variables
```

```
##
##  1  2
## 69 31
```

¹² For another approach to summarizing your data, try `library(skimr)` then `skim(mydata)` or `skim(mydata$x)`.
